Sequence 7, Application US/07932200

Patent No. 5366862

GENERAL INFORMATION:
APPLICANT: WENTON, DUANE L.
APPLICANT: HOPFINGER, ANTON J.
TITLE OF INVENTION: WEFFOR GENERATING AND SCREENING
TITLE OF INVENTION: USFFUL PEPTIDES
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS: 20
CORRESPONDENCE ADDRESS: NEIMARK
STREET: A19 SEVENTH STREET, N.W.
CITY: WARMINGTON
STATE: D.C.

i Sequence 11. Application US/08294434

patent No. 5635371

GENERAL INFORMATION:

APPLICANT: Stout, Jay

APPLICANT: Magner, Fred W.

APPLICANT: Colidge, Thomas R.

APPLICANT: Magner, Fred W.

APPLICANT: Modifie, Barton

ITLE OF INVENTION: MODIFICATION OF THE N- AND/OR C-TERMINAL AMINO ACID

ITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT

ITLE OF INVENTION: POLYPEPTIDE.OR A PORTION THEREOF

NUMBER OF SEQUENCES: 15

CORRESPONDENCE ADDRESS:

ADDRESSES: Merchant & Gould

STREET: 3100 No. 5635371west Center

Sequence 11, Application US/08457166

Patent No. 556456

GENERAL INFORMATION:

APPLICANT: Stout, Jay

APPLICANT: Coolidge, Thomas R.

APPLICANT: Holmquist, Barton

TITLE OF INVENTION: CHEMICAL METHOD FOR SELECTIVE

TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT

TITLE OF INVENTION: POLYBETIDE OR A PORTION THEREOF

NUMBER OF SEQUENCES: 15

CORRESPONDENCE ADDRESS:

ADDRESSEE: Merchant & Gould

STREET: 3100 No. 5656456west Center

ó,

```
Synthetic peptides beginning with the sequence Gly-Pro-Arg (e.g. GPRP) will bind to fibrinogen and prevent fibrin polymerisation. A scrambling traction was used to determine whether unique GPR-like peptides could be created from a reaction seeded with GPR and if these new products could bind to fibrinogen. See e.g. AAR32379. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying peptide(s) which bond to predetermined targets - by random degradation and recombination of peptide(s) and isolating bound

The inventors claim a method for inexpensively and rapidly producing a large and varied population of peptides and screening this varied population for the presence of peptides which bind to a target, for example, a macromolecule associated with a particular physiological function. The specific binding peptides are isolated and sequenced, synthesised on a large-scale, their biological activity is demonstrated, and then subjected to clinical testing. The random population of peptides is generated by employing a scrambling system which utilises one or more proteins esp. papain, pepsin, bromelin, thermolysin, trypsin, pronase, chymctrypsin, subtilism and dipeptidyl peptidase IV. A typical starting processes, partic. fibrinogen, sickle cell haemoglobin, collagenase IV, remain; Gp. IIb IIIa or phospholipase A2. It has been demonstrated that synthetic peptides beginning with the sequence GPR will bind to fibrinogen. Such peptides include GPR, GPRP and GPRV. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                          Identifying peptides which binds to a specific target - by contacting target with scrambled equilibrium mixt. of many peptide derived from protein by incubation with protease, for detecting potential therapeutic

In the qualitative or quantitative determn. Of thrombin-induced platelet aggregation in the presence of fibrin, interference from fibrin clot formation is suppressed with a fibrin-aggregation inhibitor (e.g. AAM09861-63). The assay may be used to determine the platelet aggregation inhibitory activity of thrombin inhibitors. The peptides inhibit fibrin clot formation at high thrombin concns. without inhibiting platelet
                                                                                                                                 Determn. of thrombin-induced platelet aggregation in presence of fibrin comprises use of fibrin aggregation inhibitor to suppress fibrin clot formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            used

tripeptide, Gly-Pro-Arg is also claimed. This tripeptide sequence tripeptide, Gly-Pro-Arg is also claimed. This tripeptide sequence tripeptide, Gly-Pro-Arg is also claimed. This tripeptide sequence trooperated to the first 3 amino acids of the alpha-chain exposed by the thrombin catalysed release of the fibrinopeptide A in all vetebrate species. In the present peptide, the addition of a proline residue at postion 4 increases the affinity of the peptide for fibrinosen almost tenfold. These synthetic fibrinogen binding peptides are immobilised on a novel polysaccharide support (e.g. Sephadex), to which they are coupled through a spacer or linker moiety. This linker moiety comprises a chain of greater then 7 atoms. The solid support is useful for the recovery and isolation of fibrinogen from material such as plasma, plasma fractions and fibrinogen—containing cell culture media arising from the production other known affinity isolation procedures. The process is superior to other known affinity isolation procedures in that only mild elution by buffers are required to recover the bound fibrinogen.
operations. Preferred irrigation solutions are electrolyte-free and contain I microgofmit to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, LDA, DGRA, GRRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S

This sequence represents a targeting ligand directed to the GPIIDIIIa receptor. The invention relates to a concrast agent for diagnostic imaging or a target composition which comprises: (i) a lipid, protein or polymer and (ii) a gas, in combination with (iii) a targeting ligand (TI). Ti targets calls or receptors selected from myocardial, endothelial, epithelial and tumnour cells and the glycoprotein GPIIDIIIa receptor. Also claimed are: a composition comprising vesicles containing (i) - (iii) and an aqueous carrier; a targeted vesicle composition comprising a fluorinated gas and a targeting ligand (TI) which targets tissues or receptors; a formulation for therapoutic or diagnostic use comprising (i)-(iii) and a bloactive agent; and a method for providing in mage of an internal region of a patient, or for diagnostic the presence of diseased tissue, comprising (a) administration of a composition as above; and (b) scanning the patient using ultrasound to obtain a visible image of the region or diseased tissue. The methods and compounds are cospering in the indial patient using ultrasound to obtain a visible image of the region or diagnosing the presence of diseased tissue, ceppecially myocardial, endothalial or epithelial tissue but also gastrointestinal and cardiovascular regions. In particular the ligand trangers regions of arteriosclerosis. Stabilised vesicles are particularly useful for nerfusion in the vesicle as a particularly useful for nerfusion in the vesicle as a particularly useful for nerfusion in the vesicle as a particularly useful for nerfusion in the vesicle as a particularly useful for nerfusion in the vesicle as a particularly useful for nerfusion in the vesicle as a particularly useful for nerfusion in the vesicle as a particular vesicle as a particular vesicle and composition in the vesicle as a particular or epithelial vesicle as a particular vesicle as a particular vesicle as a particular vesicle and composition and arteriors or a vesicle as a particular vesicle as a particular vesicle and c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful for perfusion imaging. The vesicles may also be used to deliver active agents to an intended target such as tissue or a receptor, and ilrasound can then be used to promote rupture of the vesicles and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Contrast agent or targeted compsn. for imaging or treating diseased tissue - comprising lipid, protein or polymer, a gas, and a targeting ligand e.g. a protein, peptide, saccharide or steroid.
                                                                                                                                                                                                                                                                                                                               Targeting ligand directed to the glycoprotein GPIIb/IIIa receptor.
                                                                                                                                                                                                                                                                                                                                                                              Contrast agent, targeted composition, diagnosis, diseased tissue, glycoprotein GPIIb/IIIa receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ultrasound can then be used to promote rupture of release a bioactive or diagnostic agent

New assays for determination of activity of components in the Protein C anticoagulant pathway, used for the study of diseases such as deep venous thrombosis and pulmonary embolism.
                         Fibrin polymerisation inhibitor; factor Xa; thrombin; factor VIII; factor X; cosgulation factor; blood; photometric; frotein C anticoagulant pathway; thromboembolic disease; deep venous thrombosis; pulmonary embolism.
  Fibrin polymerisation inhibitor peptide
                                                                                                                                                                                                            (CHRO-) CHROMOGENIX AB
                                                                                                                                                                                                                                     Rosen BS, Hall CMY;
                                                                                                                                                                                                                                                           WPI; 1999-571846/48.
                                                                                                              WO9947699-A1.
                                                                                                                                                              11-MAR-1999;
                                                                                                                                                                                     .9-MAR-1998;
                                                                                                                                      3-SEP-1999
                                                                                        Synthetic.
   The invention relates to new thrombolytic agents which comprise a thrombolytic proteinase covalently linked to a targeting compound capable of specifically binding to a component of a thrombol. The thrombolytic agents can be used for elaminating thrombi in vivo in, e.g. myocardial infarction, cerebral ischaemia, deep vein thrombosis or pulmonary image thrombolytic agent can also be used to specifically targeted to thrombolytic agent can also be used to specifically targeted to thrombol sites in vivo and have minimal amemorrhapic side effects and side effects related to non-specific proteolysis. Multiple copies of the present amino acid sequence (GPRP) may be used in a fibrin-specific targeting compound. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

Assays have been developed for the determination of activity of components in the Protein C anticoagulant pathway using additional metal ions to improve the sensitivity of the assays. An in vitro photcometric method for qualitative screening and quantitative determination of the functional activity of components of the Protein C anticoagulant pathway of body coagulation, comprises measuring the conversion rate of an exogenous substrate by an enzyme. The activity of the enzyme is related to the Protein C anticoagulant activity, in a blood sample of a human of coagulation factors and the exogenous substrate after at least partial activation of coagulation through the intrinsic, extrinsic, or partial activation of coagulation py: (1) adding calcium ions; common pathway and triggering coagulation by: (1) adding calcium ions; common pathway and triggering coagulation by: (1) adding calcium ions; common pathway and triggering coagulation by: (1) adding calcium ions; adding further metal(s) ions selected from divalent metal ions and coagulation, for determination of free Protein C anticoagulant pathway of blood coagulation, for determination of free Protein S activity in a blood sample, coagulation, for determination of free Protein C activity in a blood sample, coagulation and diagnosing of defects in the Protein C activity in a blood sample, coagulation and diagnosing of defects in the Protein C activity in a blood sample, coagulate pathway in investigation of patients with thromboembolic diseases such as deep venous thromboens and/or pulmonary embolism. The present sequence represents a fibrin polymerication inhibitor for use in

```
This sequence represents a peptide that can form the low mol.wt.

Component of a novel biologically active factor that is capable of
influencing the differentiation, proliferation and/or maintenance of
component cells. The factor consists of a low mol.wt. component
selected from Pro. Pro-Ala, Ala-Pro-Gly, Pro-OH-Pro, Pro-Gly, Gly-Pro-
CC Ala, Gly-Pro-OH-Pro, a peptide given in AAY32378-82, or a protease
cd digested (including collagenase digested) collagen fragment, and a high
cmol.wt. component such as fibronectin. The biologically active factor is
cobtained from conditioned media of hepatic or hepatoma cells or cell
consisted active factor is
capable of causing the transition of pluripotent cells (e.g. embryonic
capable of causing the transition of pluripotent cells (e.g. embryonic
cells having different properties, more specifically primitive ectoderm-
cclls (EDP) cells. The factor is also capable of maintaining and
supporting proliferation of these cells in vitro. It also allows the
collation and maintenance of EDL cells derived from in vitro and in vivo
primitive eccoderm. These cells can be used from in vitro and in vivo
creplacement, and gene therapy. They can also be used for producing
chimeric or transgenic animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Thrombus imaging; fibrin polymerisation site; technetium-99m; Tc-99m; GPIIb/IIIa receptor; cyclic peptide ligand.
                                                                                                                                                                                                                                                                                               New isolated biologically active factor capable of influencing differentiation, proliferation or maintenance of pluripotent cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 25; DB 3; Length 4; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel aqueous suspension of monodisperse table against dissolving upon dilution with an alcohol-free aqueous stable against dissolving upon dilution with an alcohol-free aqueous medium. The method involves (a) forming an aqueous solution containing albumin and hemoglobin and (b) treating the aqueous solution ontaining alcohol to cause the solution to become turbid. The particles are useful as agents for in vivo administration, either of their own administration or as a vehicle for other therapeutic or diagnostic agents. The method permits the formation of albumin and hemoglobin particles in the method nanometer and micrometer size range, in a form closer to their natural form than the forms of the prior art. The particles therefore constitute amore closely controlled agent for in vivo administration, with greater ease of clearance from the body after their period of usefulness.

This sequence represents the fibrin polymerisation site. The invention relates to a complex (A) for thrombus imaging comprises technetium-99m (Tc-99m) completed with a reagent comprising a peptide (P) with 4 to 100 amino acids sequence and a Tc-99m binding moiety covalently bound to (P). (P) is selected from a linear peptide ligand for a GPIDIATIA receptor not comprising the amino acid sequence (arginine-glycine-aspartate) a peptide ligand for a polymerisation site of fibrin, and a cyclic peptide ligand for the GPIDATIA receptor. The thrombus imaging reagents provided by the present invention can be used for visualising thrombi in a mammalian body when Tc-99m is labelled Claim 7; Col 31-32; 18pp; English Sequence 4 AA;

Ultrasound method, useful for diagnosis of e.g. thrombi or carcinomas, uses different types of energy for priming and interrogating the subject.

Disclosure; Page 68; 211pp; English.

The present invention describes an ultrasound method comprising: (i) administering a targeted vesicle composition $(A)_i$ and (ii) scanning the subject by exposure to a first type of ultrasound energy and then

interrogating with a second type of ultrasound energy. (A) consists of a combination a lipid, protein or polymer, encapsulating a gas, in combination with a targeting ligand. The method is used to detect: (I) a thrombus (particularly old or echogenic); (II) a low concentration of vesicles; or (III) vesicles targeted to endothelial tissue, particularly those containing integrins associated with malignancy or inflammation in early or small lesions, e.g. atherosclerotic plaque or ovarian, microbubbles and reduces background noise. The present sequence represents a targeting ligand peptide which is used in the method of the present invention
                                                                                                                                                                                                                                            Gaps

The present invention describes protected amino-substituted compounds with an acylated N-methyl-alpha-aminoisobutyryl (NMeAib) moiety as the amino protecting group. These can be used in chemical synthesis and in drug delivery. They can be used as prodrugs which have improved biostability or bioavailability. The present sequence is a peptide described in the exemplification of the invention Length 4; Sequence 4 AA;

This invention relates to a novel targeted compound having a combination of hydrophobic compound, hydrophilic polymer and targeting ligand. The invention also comprises a target vesicle composition comprising ligand. The protein or polymer gas filled vesicles in an aqueous carrier, a method for imaging a thrombus in a region of a patient involving administering to the patient a target vehicle composition and scanning the region (preferably cardiac region) with diagnostic imaging a thrombus in a blood or internal region of a patient which can be used to obtain a visible image of a region (preferably arteriosclerosis, atherosclerotic plaque, infarcted myocardium or a cancer cell) and a method for diagnosing the presence of disease tissue in a patient involving administering a target vehicle composition and scanning the patient using ultrasound to obtain a visible image of the region. The methods of the invention may be used for inaging a thrombus in a region of a patient, lysing a thrombus in a blood vessel, diagnosing the presence of diseased tissue in a patient and for the the therapeutic delivery in vivo of a bioactive agent. The compounds of the invention are easily synthesised and have diagnostic efficacy, art methods when represents a farceting lor the the

This invention describes a novel DNA construct encoding a polypeptide comprising several oligopeptide units and including recognition sites for peptide cleavage. The products of the invention have cytostatic and antibacterial activity, inhibit tumour cell adhesion and can be used to prepare vaccines. The constructs are used for recombinant production of peptides used, in a rinse solution, to reduce the high rate of relapse in superficial bladder carcinoma after transurethral resection or as antimicrobial peptides for control of antibiotic-resistant bacteria in human or veterinary medicine. The constructs allow the possible concentration and reduced cost. This sequence represents an oligopeptide described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                          New DNA construct encoding polypeptide that includes cleavage sites, useful for preparation of pharmaceutical peptides or their mixtures.

The present invention relates to a novel ultrasound method which involves administering to a patient a targeted vesicle composition which comprises commissionable and as a combination with a targeting ligand, and scanning the patient using dual frequency ultrasound insonation. The canning the patient using dual frequency ultrasound insonation. The vesicles themselves comprise a lipid, protein or polymer, and are to phospholipid selected from diolecylphosphatidylcholine, dipalmitoylphosphatidylcholine, distance, dipalmitoylphosphatidylcholine, distance, dipalmitoylphosphatidylcholine, distance, dipalmitoylphosphatidylcholine, distance, dis

The invention describes a method of inducing proinflammatory effects in synovial or fibroblast cells comprising exposing the cells to a specific tetrapeptide (GRRP) peptide (I). (I) is used for inducing proinflammatory effects in synovial or fibroblast cells. An analogue of (I) is used for treating or preventing inflammation of a synovial joint or rheumatoid arthrits in a subject. (I) is used to identify a receptor for (I) comprising exposing several fibroblastic cells or synovial cells to (I). (I) Can identify, isolate and clone the cell receptor to which it binds. This is the amino acid sequence of a fibrin polymerisation inhibiting peptide derived from the human fibrinogen A alpha chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention describes an isolated matrix metalloproteinase-2 (MPMP-2), MPMP-9 or MT1-MMP selective substrate polypeptide (I), or its functional peptidominetic. Also described is a method for preferentially directing a moiety to a site of MMP-2, MMP-9 or MT1-MMP activity. By administering (I) to the subject. (I) have cytostatic, antiinflammatory and neuroprotective activities, and can be used in gene therapy. The polypeptides and methods from the present invention can be used for heurodegenerative diseases. Asstaglogenesis, inflammatory or neurodegenerative diseases. Asstaglogenesis, inflammatory or neurodegenerative diseases. Asstaglogenesis in the exemplification of the present invention
                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Thrombin inhibitor; catalytic site; fibrinogen gamma chain; gamma' chain; thrombin exocite; hirutonin-2.
                                                                                                                                                                                                                        The sequences represented by AAR80046 and AAR80048-R80059 are substrates for the novel peptidase of the invention. The peptidase hydrolyses P-P-P-P-P-A- and P-P-B and recognises the proline at the second residue from the N-terminal of a peptida to release the N-terminal amino acid. The enzyme's activity is stimulated with Mnc12 and inhibited with ophenanthroline and 2-mercaptoethanol. The peptidase is useful for the hydrolysis of proline containing physiologically active peptides, oligoproline and proline rich proteins in the living body, particularly in the brain of mammals. The peptidase is useful for the present of proline rich proteins and treatment of proline rich protein related diseases and study of cerebral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thrombin inhibitor useful for inhibition of thrombin-mediated functions comprises a means for inactivating or sequestering thrombin and portion of fibrinogen chain that binds at the anion-binding exosite of thrombin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The peptide is useful for treatment of tumours, infections caused by virus, bacteria or fungi, or autoimmune disease. It can be administered orally or parenterally at daily dose of 1-500 mg (p.o.) for adults. The cyclisation is effected with a condensing agent in a solvent opt. in the presence of a base at -50 degrees C to 50 degrees C for 30 minutes to 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The invention relates to a new thrombin inhibitor which comprises: (a) a means for inactivating or sequestering thrombin, and (b) a portion of the fibrinogen gamma. Chain that binds at the anion-binding exosite of thrombin. Also claimed is a recombinant genetic construct comprising nucleic acid sequences encoding the inhibitor above. The inhibitor comprises three segments, the first binds to the catalytic site of thrombin, the second connects the first binds to the catalytic site of thrombin, the second connects the first and third segments, and the third comprises a portion of the fibrinogen gamma' chain that binds to the thrombin exosite. The third segment is preferably amino acids 414-427 of the native human fibrinogen gamma' sequence. The inhibitor is useful for the inhibition of thrombin-mediated functions in a patient or in extracorporeal blood. The present sequence represents a thrombin catalytic site inhibitor, hirutonin-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      spiro[Pyrrolidine-2':3-piperidin-2-ones] and their fused ring analogues used, e.g. to modulate signal transduction protein interactions, inhibit cell growth and for use in treating infections and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Src homology 3 domain; SH3 domain; peptidomimetic; mimetic; modulator; beta-turn template; spiro[pyrotlidine-2':3-piperidin-2-ones]; fused ring analogue; signal transduction protein interaction; inhibit cell growth; infection; cancer.
                                                                                                                                                                                                                                                                                                       h Similarity 100.0%; Score 19; DB 2; Length 4; Similarity 100.0%; Pred. The present invention describes spiro[Pyrrolidine-2':3-piperidin-2-ones], their fused ring analogues, and salts of both, all as individual compounds or their libraries. They are peptidonimetics, and interact with protein Src homology 3 (SH3) domains, involved in protein-protein

ö

Gaps ;

ö
interactions in signal transduction. They cause disruption of the pathway in particular, they inhibit the protein tyrosine kinase system involved in cell growth regulation. The cells may be microbial, e.g. pathoganic bacterial or fungal cells responsible for infections, or of transformed cells, e.g. responsible for neoplastic conditions. Specific examples of Src proteins with SH3 domains are those known by the abbreviations p85, Fyn, Lyn, Hck, Syk, GrD, Gap, STAT, p47-phox, p67-phox, and Brk. The present sequence represents a tetrapeptide used in a spiro[Pyrrolidine-2':3-piperidin-2-ones] of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to peptides with anti-angiogenic activity. The peptides of the invention are useful for inhibiting angiogenesis, for treating conditions that arise from, or are exacerbated by, angiogenesis such as cancer, autoimmune diseases (e.g. rheumatoid, immune and dependentive arthritis), ocular diseases (e.g. diabetic rethinopathy), skin diseases (e.g. psoriasis), blood vessel diseases (e.g. haemangiomas) crohn's disease, atherosclerosis, keloids, or ulcers, or for preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        γ̈́
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compounds with anti-angiogenic activity, useful for inhibiting angiogenesis, treating conditions that arise from, or are exacerbated angiogenesis, e.g. cancer or autoimmune diseases, or preventing metaatases from tumors.

New recombinant fusion protein comprising detection and first localization domains and a binding domain for the molecule of interest, useful for detecting binding of a molecule of interest.

Claim 8; SEQ ID NO 115; 101pp; English

The present invention describes a recombinant fusion protein (I) for detecting binding of a molecule of interest. (I) comprises: (a) a detecting binding of a molecule of interest. (I) comprises: (a) a detection domain, (b) a first localisation domain, the first localisation domain and the binding domain for the molecule of interest constituting the recombinant fusion protein for detecting binding of a molecule of interest are operably linked. The binding domain for the molecule of interest is separated from the first localisation domain by 0.20 amino acid residues. The first localisation domain by 0.20 amino acid residues. The first localisation domain and the binding compinant for the molecule of interest both do not occur in a single non-recombinant protein with the same spacing as in the recombinant fusion protein; (1) a recombinant expression vector comprising the nucleic acid molecule; (2) a recombinant expression vector comprising the nucleic acid molecule; (3) a squences operably linked to the recombinant mucleic acid molecule; (3) a genetically engineered host cell transfected with the recombinant expression vector; (4) a kit for detecting binding of the molecule of interest, and (5) a method for identifying compounds that alter the binding of the molecule of interest. The recombinant fusion protein is

ö useful for detecting binding of a molecule of interest. The recombinant fusion protein eliminates the need to construct two or more chimeric proteins and enables the monitoring of biochemical events in live, intact or fixed cells. The present sequence is used in the exemplification of the present invention. Gaps ., Query Match 76.0%; Score 19; DB 7; Length 4; Best Local Similarity 100.0%; Pred. of of Assaying target analytes in a sample comprises determining the extent binding between the target analyte and the solid support-bound ligand the analyte useful for conducting multiplexed assays of multiple analytes. WPI; 2003-689583/65.

Disclosure; Page 33; 48pp; English.

The invention relates to a method for assaying target analyte(s). The steric interference is provided by a solid support (s1). The method construction interference is provided by a solid support (s1). The method convolution is involves assaying target analyte(s) (A) in a sample comprises providing (A) and binding ligand (1) of (A) bound to a solid support, where the construction is porous, the ligand is bound within the pores of the support of the binding ligand to bind to (A) that does not hinder the binding of all cher target analyte(s) to all other binding ligand so all cher binding ligand to bind to (A) that does not hinder the binding of all cher target analyte (s) simultaneously assaying multiple different analytes and permits each target analyte to be assayed within a dynamic analyte analyte. The method permits assayed to be conducted within their dynamic range without a need to dilute the reactants, therefore, achieving a virtual dilution. The method permits measurement of high concentration analytes in the same reaction mixture as low concentration analytes in the same reaction mixture as low concentration analytes therefore, reducing the number of separate analyses necessary to complete a full clinical menu. The measurement does not require problematic low-affinity receptors and does not significantly expresents a leaving group peptide for use in a cellprobe reagent for represents a leaving group peptide for use in a cellprobe reagent for

The invention relates to a method for assaying target analyte(s). The steric interference is provided by a solid support (s1). The method involves assaying trarget analyte(s) (A) in a sample comprises providing (A) and binding ligand (1) bound to a solid support, where the support is porous, the ligand is bound within the pores of the support ability and the pores sterically interfere with the ability of the chinding ligand to bind to (A) that does not hinder the binding of all other target analyte(s) to all other binding ligand(s). The method is efficiently capable of simultaneously assaying multiple different analytes and permits each target analyte to be assayed within a dynamic assay range for that analyte. The method permits assays to be conducted within their dynamic range without a need to dilute the reactants, therefore, achieving a virtual dilution. The method permits measurement of high concentration analytes in the same reaction mixture as low concentration analytes therefore, reducing the number of separate analyses necessary to complete a full clinical measurement does not require problematic low-affinity receptors and does not significantly affect other analyses in the reaction mixture. The current sequence

```
The invention relates to a method for assaying target analyte(s). The steric interference is provided by a solid support (s1). The method involves assaying target analyte(s) (A) in a sample comprises providing (A) and binding ligand (1) of (A) bound to a solid support, where the support is porous, the ligand is bound within the pores of the support ability, and the pores sterically interfere with the ability of the binding ligand to bind to (A) that does not hinder the binding of all other target analyte(s) to all other binding ligand(s). The method is other target analyte(s) to all other binding ligand(s). The method is efficiently capable of simultaneously assaying multiple different analytes and permits each target analyte to be assayed within a dynamic assay range for that analyte. The method permits assays to be conducted within their dynamic range without a need to dilute the reactants, therefore, achieving a virtual dilution. The method permits measurement of high concentration analytes in the same reaction mixture as low analyses necessary to complete a full clinical menu. The measurement does not sequire problement lower in the reaction mixture as significantly affect the require problement of mixture and analyses therefore, reducing the number of separate analyses problement of now and significantly affect there are in the reaction mixture as an analyses problement of mixture and now and significantly affect there are in the reaction mixture and now and significantly affect therefore in the reaction mixture and now and significantly affect therefore in the reaction mixture and now and significantly affect the reaction and now and significantly and remains and now and significantly and the reaction and now and significantly and the same reaction and now and significant of the same reaction and now and significant 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  향
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Assaying target analytes in a sample comprises determining the extent binding between the target analyte and the solid support-bound ligand the analyte useful for conducting multiplexed assays of multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         affect other analyses in the reaction mixture. The current sequence represents a leaving group peptide for use in a cellprobe reagent for assaying enzyme activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to a novel system for reconstitution of osseous tissue comprising a scaffold carrying a compound (1) that promotes bone tissue comprising a scaffold carrying a compound (1) that promotes bone formation and a component that decreases bone resorption (II). (I) induces migration and adhesion of osteoblasts and osteoclasts and (II) inhibits proteolysis (specifically by plasmin) of extracellular matrix.

(I) is preferably selected from: selectin or selectin binding fragments, proteins and peptides that facilitate cell adhesion, plasminogen activator inhibitors, protease inhibitors and metalloprotease inhibitors. The peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss. Incorporation of (I) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold celeigned to have a predetermined resolved; and may include regulatory compounds for
                                                                                                                                                                                                                                                                                                                                                                                             System for reconstructing osseous tissue, useful e.g. for treating fractures, comprises scaffold containing promoter of bone formation and inhibitor of bone resorption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a tri-, tetra-, or pentapeptide compound (I). (I) or a salt of it, is used in a pharmaceutical composition for inhibiting anglogenessis or for treating cancer in a mammal. (I) can also be used for the prevention or treatment of other diseases, such as autoimmune diseases, e.g. rheumatoid, immune and degenerative arthritis. This is the amino acid sequence of an anglogenesis inhibiting peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer in

The invention describes a method of producing a peptide comprising the excision of the N and C-terminals of a trarget peptide with enzymes or chemically through the attached cleavage sites repeated by ligation in precursor protein. The method is for producing (low-molecular) peptides e.g. KiSS-1 peptides and GPR8 ligand for subsequent applications by the gene recombination technique through tandem repeats to provide a precursor protein with specific cleavage sites. With this method, peptide production can be carried out easily to provide large quantities of the required peptides. This is the amino acid sequence of a peptide associated with the peptide production method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The binding peptide is covalently linked to a 'Cp(aa)Cp' technetium binding group wherin Cp is a protected cysteine and (aa) is an amino acid. The technetium-99m complexes are used to image target sites within a mammalian body. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Technetium-99m labelled polypeptide imaging agent; radiolabeled imaging; radiodiagnostic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New technetium-99m labelled polypeptide imaging agents - for imaging of clots, tumours, infection sites, atherosclerotic and amyloid plaques or bone, and for visualising organs.
                                                                                           Process for producing peptides e.g. KiSS-1 peptide and GPR8 ligand for subsequent applications by gene recombination technique through tandem repeats to provide precursor protein with specific cleavage sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy! and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a possibilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modiffying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disconders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.

Wodifying and attaching therapeutic peptides to allouin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases.

Chabbods to AABD341 represent peptides which can be used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                             Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide production by gene recombination associated peptide #42.

Synthetic peptides beginning with the sequence Gly-Pro-Arg will bind to fibrinogen and prevent fibrin polymerisation. A scrambling reaction was used to determine whether unique GRP-like peptides could be created from a reaction seeded with GPR and if these new products could bind to fibrinogen. The peptide GPRL was one of the new peptides to be generated by hydrolysis/synthesis of fibrinogen/GPR. It inhibits fibrin polymerisation but its affinity was less than that of GPR or GPRP. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                   Identifying peptide(s) which bond to predetermined targets - by random degradation and recombination of peptide(s) and isolating bound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic peptides beginning with the sequence Gly-Pro-Arg (e.g. GPRV) will bind to fibrinogen and prevent fibrin polymerisation. A scrambling reaction was used to determine whether unique GPR-like peptides could be created from a reaction seeded with GPR and if these new products could bind to fibrinogen. See e.g. AAR32379. In order to produce recombinant polypeptides with C-terminal alpha-amide groups and/or N-terminal acetyl groups, fusion proteins are formed in which the relevant terminus (termini) of the polypeptide is protected by a biological protecting group. The protecting group is a peptide or amino acid having at least one cleavage site for its removal. The sequence AAR48072 represents a suitable biological protecting group, i.e. a Thrombin cleavage site. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A recombinant multicopy fusion protein was formed in which human carbonic anhydrase was connected (via interconnecting peptide AAR46079) to a multicopy polypeptide containing 2 copies of GRF (intraconnected by peptide AAR48079). The inter- and intraconnecting peptide contains a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C-terminal modification, amidation, biological protecting group, N-terminal modification, recombinant multicopy fusion protein; human carbonic amydraes, interconnecting peptide; GRF; intraconnecting peptide, hydroxylamine; chemical cleavage site; thrombin, enzymatic cleavage site; Growth Hormone releasing factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Terminal modification of recombinant single copy polypeptide - by protecting, modifying and de-protecting polypeptide, e.g. fusion protein, contg. biologically added protecting gp.

                                                                                                                                                                                                                                                                                                                                                                                       Synthetic peptides beginning with the sequence Gly-Pro-Arg will bind to fibrinogen and prevent fibrin polymerisation. A scrambling reaction was used to determine whether unique GPR-like peptides could be created from a reaction seeded with GPR and if these new products could bind to fibrinogen. The peptide GPRF was one of the new peptides to be generated by hydrolysis/synthesis of fibrinogen/GPR. It was less active than GPRL (AAR32384) which was also generated by scrambling; GPRL inhibits fibrin polymerisation but its affinity was less than that of GPR or GPRP. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     C-terminal alpha-amide polypeptide; amidation; protecting group; N-terminal alpha-acetyl polypeptide; acetylation; recombinant multicopy fusion protein; interconnecting peptide; interconnecting peptide; interconnecting peptide; Blood coagulation; Thrombin; recognition site.

The inventors claim a method for inexpensively and rapidly producing a large and varied population of peptides and soreening this varied population for the presence of peptides which bind to a target, for example, a macromolecule associated with a particular physiological function. The specific binding peptides are isolated and sequenced, synthesised on a large-scale, their biological activity is demonstrated, and then subjected to clinical testing. The random population of peptides is generated by employing a scrambling system which utlises one or more proceases, esp. papain, pepsin, bromelin, thermolysin, trypsin, promase, chymotrypsin, subtilism and dipppidy peptidase IV. A typical starting proceases, partic. fibringen; sickle cell haemoglobin; collagenase IV; rennin, Gp. IIb IIIa or phospholipase A2. It has been demonstrated that csyptides beginning with the sequence GPR will bind to fibringen. Such peptides include GPR, GFRP and GPRV. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying peptides which binds to a specific target - by contacting target with scrambled equilibrium mixt. of many peptide derived from protein by incubation with protease, for detecting potential therapeutic

The inventors claim a method for inexpensively and rapidly producing a large and varied population of peptides and screening this varied population for the presence of peptides which bind to a target, for example, a macromolecule associated with a particular physiological carample, a macromolecule associated with a particular physiological function. The specific binding peptides are isolated and sequenced, synthesised on a large-scale, their biological activity is demonstrated, and then subjected to clinical testing. The random population of peptides is generated by employing a scrambling yetem which utilises one or more proteases, esp. papain, pepsing. The random population of peptides is generated by employing a scrambling yetem which utilises one or more proteases, esp. papain, pepsing peptidase IV. A typical starting protein is casein. Targets are esp. receptors involved in physiological processes, partic. fibrinogen; sickle cell heamoglobin; collagenase IV; cennin; Gp. IID IIIa or phospholipase AZ. It has been demonstrated that synthetic peptides beginning with the sequence GPR will bind to fibrinogen. Such peptides include GPR, GPRP and GPRV. HPLC fractions bound to fibrinogen were screened on CE. Three of these GPR peaks were collected and sequenced and found to be GPRL, GPRF and LPK. In addition, a GPR independent peak was also collected and found to have the sequence EDKPDNF. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying peptides which binds to a specific target - by contacting target with scrambled equilibrium mixt. of many peptide derived from protein by incubation with protease, for detecting potential therapeutic

Synthetic.

The inventors claim a method for inexpensively and rapidly producing a large and varied population of peptides and screening this varied population of peptides which bind to a target, for example, a macromolecule associated with a particular physiological function. The specific binding peptides are isolated and sequenced, synthesised on a large-scale, their biological activity is demonstrated, and then subjected to clinical testing. The random population of peptides is generated by employing a scrambling system which utlises one or more proceases, esp. papain, pepsin, bromelin, thermolysin, trypsin, pronase, chymotrypsin, subtilism and dipeptidyl peptidase IV. A typical starting proceases, partic. fibrinogen, sickle cell haemoglobin, collagenase IV, rennin, Gp. IIb IIIa or phospholipase A2. It has been demonstrated that spiring beginds beginning with the sequence GPR will bind to fibrinogen. Such peptides include GPR, GPRP and GPRV, HPLC fractions bound to fibrinogen were screened on CE. Three of these GPR peaks were collected and sequenced and found too be GPRL, GPRF and LPK. In addition, a GPR-independent peak was also collected and found to have the sequence of CDR PDR. (Updated on 25-MAR-2003 to correct PN field.)

The blood coagulation inhibiting peptide conprises L-form amino acids and has fibrin agglutination inhibiting activity. Such peptides (see AAR60327 486035) were synthesisez (applied Blosystems Co., 430A) and purified by high pressure liquid chromatography. To 0.2 ml of fibrinogen solution (2.5 mg/ml), 0.2 ml of test peptide solution was added and incubated for I minute at 37 deg Celsius. 0.2 ml of thrombin solution was added and the IC50 was determined according to the method of Kawasaki et al. This peptide had an IC50 of 510 micromolar compared with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences represented by AAR80046 and AAR80049-R80059 are substrates for the novel peptidase of the invention. The peptidase hydrolyses P-P-P-P-P-P-A and P-P and recognises the proline at the second residue from the N-terminal of a peptida to release the N-terminal amino acid. The enzyme's activity is stimulated with Mnc12 and inhibited with oppenanthroline and 2-mercaptoethanol. The peptidase is useful for the hydrolysis of proline containing physiologically active peptidas, oligoproline and proline rich proteins in the living body, particularly in the brain of mammals. The peptidase is useful for the prevention and treatment of proline rich protein related diseases and study of cerebral
the N-terminal of a peptide to release the N-terminal amino acid. The enzyme's activity is stimulated with Mnol2 and inhibited with ophenanthrollene and 2-mercaptochtanol. The peptidase is useful for the hydrolysis of proline containing physiologically active peptides, oligoproline and proline rich proteins in the living body, particularly oligoproline and proline rich peptidase is useful for the prevention and treatment of proline rich protein related diseases and study of cerebral

                                                                                                                                                                                                                                                                                                                                                                                                                                                      The example concerns the transpeptidation of a single copy recombinant polypoptide derived from a fusion protein construct. The binding protein of the fusion protein construct will be connected to the single copy recombinant polypeptide through an interconnecting peptide. For example, the tetraspeptide AARSO71 is a suitable interconnecting peptide for the fusion protein construct congr. the GRF (1-41). Ala-Arg-Leu-Ala single copy, recombinant polypeptide. The peptides may be coupled to a chelator molecule, which is labelled with a diagnostically useful metal nuclide to form a peptide derived radionuclide chelator molecules. Such targetted and labelled derived are used to detect pathological conditions by diagnostic imaging. Radionuclides used include 99mTc, 46tu, 67tu, 97ku, 105kh, 109Pd, 186Re, 188Re, 198Au, 199Au, 203Pb, 2122b and 212Bl. The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-1gG, 111In-WHC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        peptide derived radionuclide chelators and metal complexes - useful diagnostic imaging.

Patent No. 5314690

Patent No. 5314690

GENERAL INFORMATION:
APPLICANT: PATTERSON, ROY
APPLICANT: HARRIS, KATHLEEN E
TITLE OF INVENTION: METHOD AND COMPOSITION FOR REDUCING IGE
TITLE OF INVENTION: ANTIBODIES TO SPECIFIC ALLERGENS
NUMBER OF SEQUENCES: 5
CORRESPONDENCE ADDRESS:
ADDRESSEE: TILTON, FALLON, LUNGANUS & CHESTNUT
STREET: 100 SOUTH WACKER DRIVE
CITY: CHICAGO
STATE: ILINOIS
COUNTY: USA

Patent No. 5607859
Sequence 1, Application US/08475827A
Patent No. 5607859
GENERAL INFORMATION:
APPLICANT: Stuber, Werner
APPLICANT: Fickenscher, Karl
TITLE OF INVENTION: Preparation Thereof And Agents Containing These As
TITLE OF INVENTION: Preparation Thornol Inhibitors
NUMBER OF SEQUENCES: 22
CORRESSONDENCE ADDRESS:
ADDRESSEE: Finnegan, Henderson, Farabow, Garrett & ADDRESSEE: Punner
STREET: 1300 I Street, N.W., Suite 700
                                                                                                                                                                                                                                                                                                                                                                                                    .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Patent No. 6129923
GENERAL INFORMATION:
RAPLICANT: Unger, Yann C
APPLICANT: Unger, Yann C
APPLICANT: Wo, Yungiu
TITLE OF INVENTION: Optacoustic Contrast Agents And Methods For Their Use
FILE REPRENCE: UNGRI224
CURRENT APPLICATION NUMBER: US/08/993,165A
CURRENT FILING DATE: 1997-12-18
NUMBER OF SEQ ID NOS: 40
SOFTWARE: PatentIn Ver. 2.1
SEQ ID NO 6
LENGTH: 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

GENERAL INFORMATION:

APPLICANT: Stuber, Werner

APPLICANT: Stuber, Karl

APPLICANT: Elekenscher, Karl

TITLE OF INVENTION: Petride Amides, Processes for the

TITLE OF INVENTION: Preparation Thereof and Agents Containing These as

TITLE OF INVENTION: Fibrin/Thrombin Clotting Inhibitors

NUMBER OF SEQUENCES: 22

CORRESPONDENCE ADDRESS:

ADDRESSEE: Finnegan, Henderson, Farabow, Garrett &

ADDRESSEE: Dunner

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                Sequence 7, April cation US/08022381A
Patent No. 5478810
GENEAL INFORMATION:
APPLICANT: Stuber, Werner
APPLICANT: Stuber, Werner
APPLICANT: Fickenscher, Karl
TITLE OF INVENTION: Peptide Amides, Processes for the
TITLE OF INVENTION: Preparation Thereof and Agents Containing These as
TITLE OF INVENTION: Prizin/Thrombin Clotting Inhibitors
NUMBER OF SEGUENCES:
ADDRESSEE: Finnegan, Henderson, Farabow, Garrett &
ADDRESSEE: Dunner
STREET: 1300 I Street, N.W., Suite 700
                                                                                                    Gaps
                                                                                                    .

Sequence 2, Application US/08475827A
Patent No. 5607858
GENERAL INFORMATION: Wenner
APPLICANT: Stuber, Wenner
APPLICANT: Fickenscher, Karl
TITLE OF INVENTION: Peptide Amides, Processes For the
TITLE OF INVENTION: Preparation Thereof And Agents Containing These AS
TITLE OF INVENTION: Pibrin/Thrombin Clotting Inhibitors
NUMBER OF SEQUENCES: 22
CORRESPONDENCE ADDRESS:
ADDRESSEE: ADDRESS: ADDRESS: ADDRESSEE: Dunner ADDRESSEE: 
                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 25; DB 1; Length 5; 100.0%; Pred. No. 3e+05;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                STATE: D.C.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 6, Application US/08475827A
Patent No. 5607858
GENERAL INFORMATION.
RAPLICANT: Stuber, Werner
APPLICANT: Fickenscher, Karl
TITLE OF INVENTION: Peptide Amides, Processes For the
TITLE OF INVENTION: Preparation Thereof And Agents Containing These As
TITLE OF INVENTION: Fibrin/Thrombin Clotting Inhibitors
NUMBER OF SEQUENCES: 22

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 8, Application US/08475827A
Patent No. 5607858
GENERAL INFORMATION:
APPLICANT: Stuber, Werner
APPLICANT: Stuber, Warner
APPLICANT: Pickenscher, Karl
TITLE OF INVENTION: Peptide Amides, Processes For the
TITLE OF INVENTION: Preparation Thereof And Agents Containing These As
TITLE OF INVENTION: Fibrin/Thrombin Clotting Inhibitors
NUMBER OF SEQUENCES:
CORRESPENDENCE ADDRESS:
ADDRESSEE: Finnegan, Henderson, Farabow, Garrett &
ADDRESSEE: Dunner
STREET: 1300 I Street, N.W., Suite 700
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;
